System Recovery Inc. – Business Continuation & Disaster Recovery Services

Be Ready....Be Aware

The Scenario

A credit union's optical drive crashes and has to be replaced. A DR test has been performed to verify that the member information on the critical application is being backed up. When the optical drive is replaced and the data has to be restored back onto the optical drive, it is discovered that the optical drive has never had a backup set configured to be backed up. The information is not available, and the institution has to rebuild the data manually.

Don't let this be you!

The Solution

Description of Service Offering

Optical Drive Testing

You've secured your organization's most critical assets by implementing a disaster recovery solution. Although you thoroughly tested and verified this solution during implementation, your environment will have changed over time and may have altered the state of your systems. These include changing server configurations, altered network setups, virus infections and hardware failures. Any gap in time since the last disaster recovery test conducted will amount to a growing gap in assurance that your disaster recovery archiving system will work as planned. The only way to close this gap is to perform yearly optical drive testing.

This offering is geared toward testing archived member information on your optical drive for functionality and reliability. We will assist our clients in testing and performing data verification for the purpose of validating member information can be recovered from the optical drive their backup solution. Members will have access to all of their resources at all times.

To ensure the integrity and effectiveness of your disaster recovery capability in the face of such constant changes, it's not just sensible, but critical to conduct regular disaster recovery tests. In fact, no disaster recovery solution is complete without frequent disaster recovery testing.
